

Task 6.2C - My DNS Server

Introduction

This is basically the same code that I submitted in Task 5.2C.

Below is a screenshot of myself running this simple implementation:

<pre>PS C:\Users\uncus\Documents\GitHub\uni-deakin-26-t2\sit202_networking\task62c> python .\server.py DNS server is running on 127.0.0.1:5354 Query received: google.com - CNAME Query received: google.com - A Query received: api.example.com - A </pre>	<pre>PS C:\Users\uncus\Documents\GitHub\uni-deakin-26-t2\sit202_networking\task62c> python .\client.py Enter hostname: google.com Enter record type (A or CNAME): CNAME Server response: DNS record not found PS C:\Users\uncus\Documents\GitHub\uni-deakin-26-t2\sit202_networking\task62c> python .\client.py Enter hostname: google.com Enter record type (A or CNAME): A Server response: A record: 142.250.70.14 PS C:\Users\uncus\Documents\GitHub\uni-deakin-26-t2\sit202_networking\task62c> python .\client.py Enter hostname: api.example.com Enter record type (A or CNAME): A Server response: A record: 192.168.1.30 </pre>
--	---

Source Code

The python code has been attached to the end of this document.
