

SIT 218/738: Secure coding

Pass task 6.1P: Error and logging

Note: Complete the steps provided in “**Ontrack Task6.1P Start Activity**” on CloudDeakin before completing this task.

Objective

In this task you will learn how errors should be correctly handled in the web applications to prevent information disclosure. Also, you will learn about the logging facilities in Java web applications and the correct use of the different log levels.

Note: Students enrolled in SIT738 need to complete additional mandatory Tasks as mentioned below.

Overview

For unit both SIT218 and SIT738 (Task 1 and Task 2):

Task 1: Use ‘**Error-logging-updated**’ webapp. Continue from the class activity where we enabled custom error page to be shown and logged our error in the updated ‘**Error-logging-updated**’ webapp. Run the webapp as explained in the “Ontrack Task6.1P Start Activity” and record the output of error page (in the browser) and logging information on the **Eclipse Console**.

Task 2: What log levels will you use in the following scenarios (refer to <https://sematext.com/blog/logging-levels/>)

- 1) Authentication failure due to wrong credentials
- 2) Failure to access a file, results in the failure of a particular operation not the entire application
- 3) Database encounters an error which results in the complete application failure

For unit SIT738 only (mandatory):

Task 3: Read the topic “Spring MVC Exception Handling (Additional resources)” in week-6 content and do further research on the topic. Then prepare a short report on different exception handling techniques of Spring MVC framework. Explain each technique with an example code in your report (Maximum three pages).

Submission Requirements:

Submit one PDF file containing the following information:

1. Provide screenshots that demonstrate the completion of Ontrack Task6.1 Start Activity
2. Screenshot of error page and Screen shot of the log shown in the eclipse console of Task 1.
3. Correct log levels to use for scenarios given in Task 2
4. Answer of Task 3.
