Attempt Score 9 / 10 - 90 %

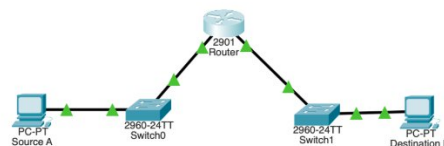

Overall Grade (Highest Attempt) 9 / 10 - 90 %

As seen here, I got one question wrong.

Question 10

0 / 1 point

Assume that Source A and Destination B are connected through a router and two switches as shown in the below figure.

Determine how many time a packet has to go through

(a) network layer

(b) data link layer

when it is transmitted from A to B

- ☐ (a) 4 times (b) 6 times
- ☐ (a) 3 times (b) 6 times
- ☐ (a) 5 times (b) 5 times
- ☐ (a) 4 times (b) 8 times
- ☒ (a) 3 times (b) 5 times

In my first attempt, I selected 3 times for the network layer and 5 times for the data link layer because I counted each device only once. After it was marked wrong, I went through it again and now think the correct answer is 3 times and 6 times. The router processes the network layer once, but handles the data link layer twice by removing the incoming frame and creating a new frame for the other LAN.
