

CSS for background image, pseudo class and shadows

Tasks

In this task a further set of styles will be applied to the various elements within the web page. An example of the *sample* output is shown in the figure below:

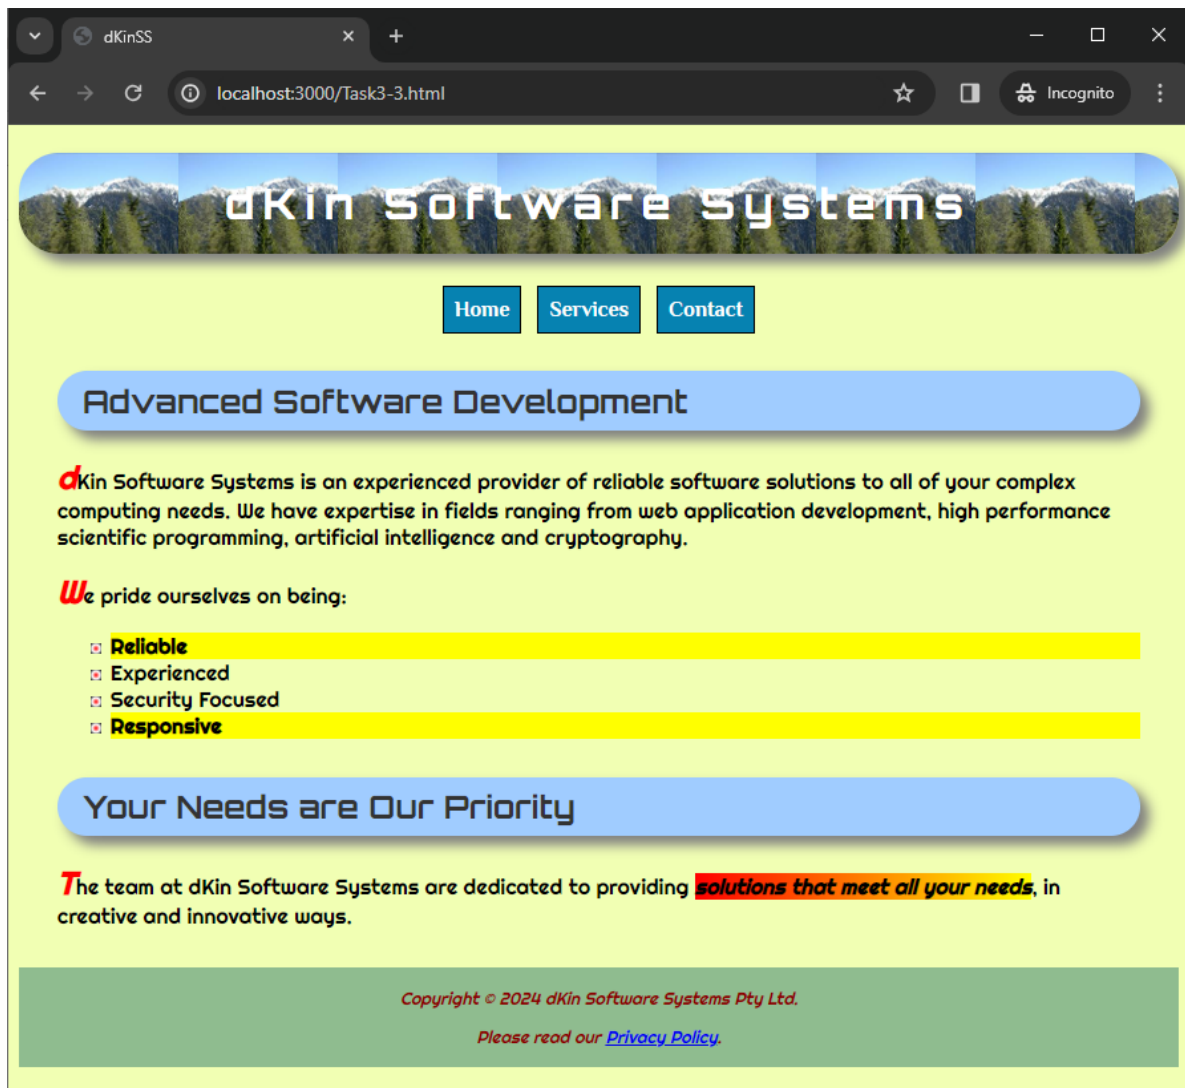

Task4.3 Example Page

Some research into some of the various CSS properties and controls will be required for this task. Please review the following resources:

- <https://www.w3schools.com/cssref/>
- <https://developer.mozilla.org/en-US/docs/Web/CSS/Reference>
- https://www.w3schools.com/cssref/tryit.asp?filename=trycss_sel_firstletter
- https://www.w3schools.com/cssref/playit.asp?filename=playcss_box-shadow

The additional styles added to this page include:

CSS Style Feature
>>> Rules For the <i>nav</i> section <<<
To start, in the <code>nav</code> element style we need to set the <code>display</code> property to <code>flex</code> and the <code>justify-content</code> to <code>center</code>
Within the <code>nav</code> element we want the <code>href</code> attribute (<code>a</code>) to have a <code>text-decoration</code> set to <code>none</code> , <code>color</code> set to <code>#ffffff</code> , <code>background-color</code> set to <code>0682b1</code> , <code>padding</code> set to <code>0.5em</code> and <code>border</code> set to <code>1px solid black</code>
Finally, we want the event handler for the <code>hover</code> on these navigation links to change the colour. So, within the <code>nav</code> element for the pseudo css rule <code>a:hover</code> apply the properties to be <code>color</code> is <code>#0682b1</code> , the <code>background-color</code> is <code>#ffffff</code> and the <code>border</code> is set to <code>1px solid #0eb482</code>
>>> Rules For the <i>main</i> section
Replace the list item symbols with something different. In the example here, we have changed the <code>list-style-image</code> property of the <code>li</code> to use an inbuilt <code>radial-gradient()</code> macro. You can apply a similar effect, or choose an <i>image</i> of your own.
Create a CSS class called <code>.highlight</code> which defines the use of a <code>background-image</code> to use a <code>linear-gradient</code> color range, and the <code>font-style</code> set to <code>italic</code> .
Create a CSS class called <code>.standout</code> which defines the use of a <code>background-color</code> (yellow in the example above) and the <code>font-weight</code> set to <code>bold</code> . This class is applied to the first and fourth list-items.
Modern CSS supports many more, powerful operations and controls. One such example, allows the <i>first</i> letter of a given element to have specific rules applied. In the example above, the <i>first</i> letter of a <i>paragraph</i> block within each <code>section</code> has been increased in size, color changed to a <i>red</i> and made <i>bold</i> and <i>italic</i> . NOTE: this rule does not apply to the <i>paragraph</i> in the <code>footer</code> section.
The <code>h1</code> has had a background image applied, using a <code>repeat-x</code> and <code>center</code> properties. You can choose your own image and apply the appropriate style effects to it.
Additional CSS Style Controls
>>> Additional <i>shadow.css</i> file
Finally, you will note that each of the headers (<code>h1</code> , <code>h2</code>) has had a <i>drop shadow</i> applied to it. This gives the page a sense of <i>depth</i> . This type of effect is also used with <i>buttons</i> in a webpage when they are 'pressed'. Here, explore the references on applying a <code>box-shadow</code> to an element and create such an effect in your example. A <code>border</code> and <code>border-radius</code> has also been applied. Note: this rule has been created in it's own CSS file that is linked into the webpage, enabling the effect to be used across multiple web pages.

Task4.3 Example Page with Added Effects

Steps:

1. Start by copying your `task4-2.html` file to a new `task4-3.html` file.
2. Copy the `styles4-2.css` file to `styles4-3.css` and use this new style file in your new webpage.
3. Extend and modify the rules within your new styles file to address the requirements listed in the table above.
4. Create a new style file `shadows.css` and link this into your webpage file.
5. Implement and apply the *drop shadow* features described above.

What will you submit?

You should submit:

- One screen-shot of your final web page showing the application of the updated style rules, classes and shadows.

- Your updated `task4-3.html` file showing the linking to the *two* new external style rules files.
- Your updated `style4-3.css` file.
- Your new `shadow.css` file.
