

Jumpstart JavaScript

Tasks

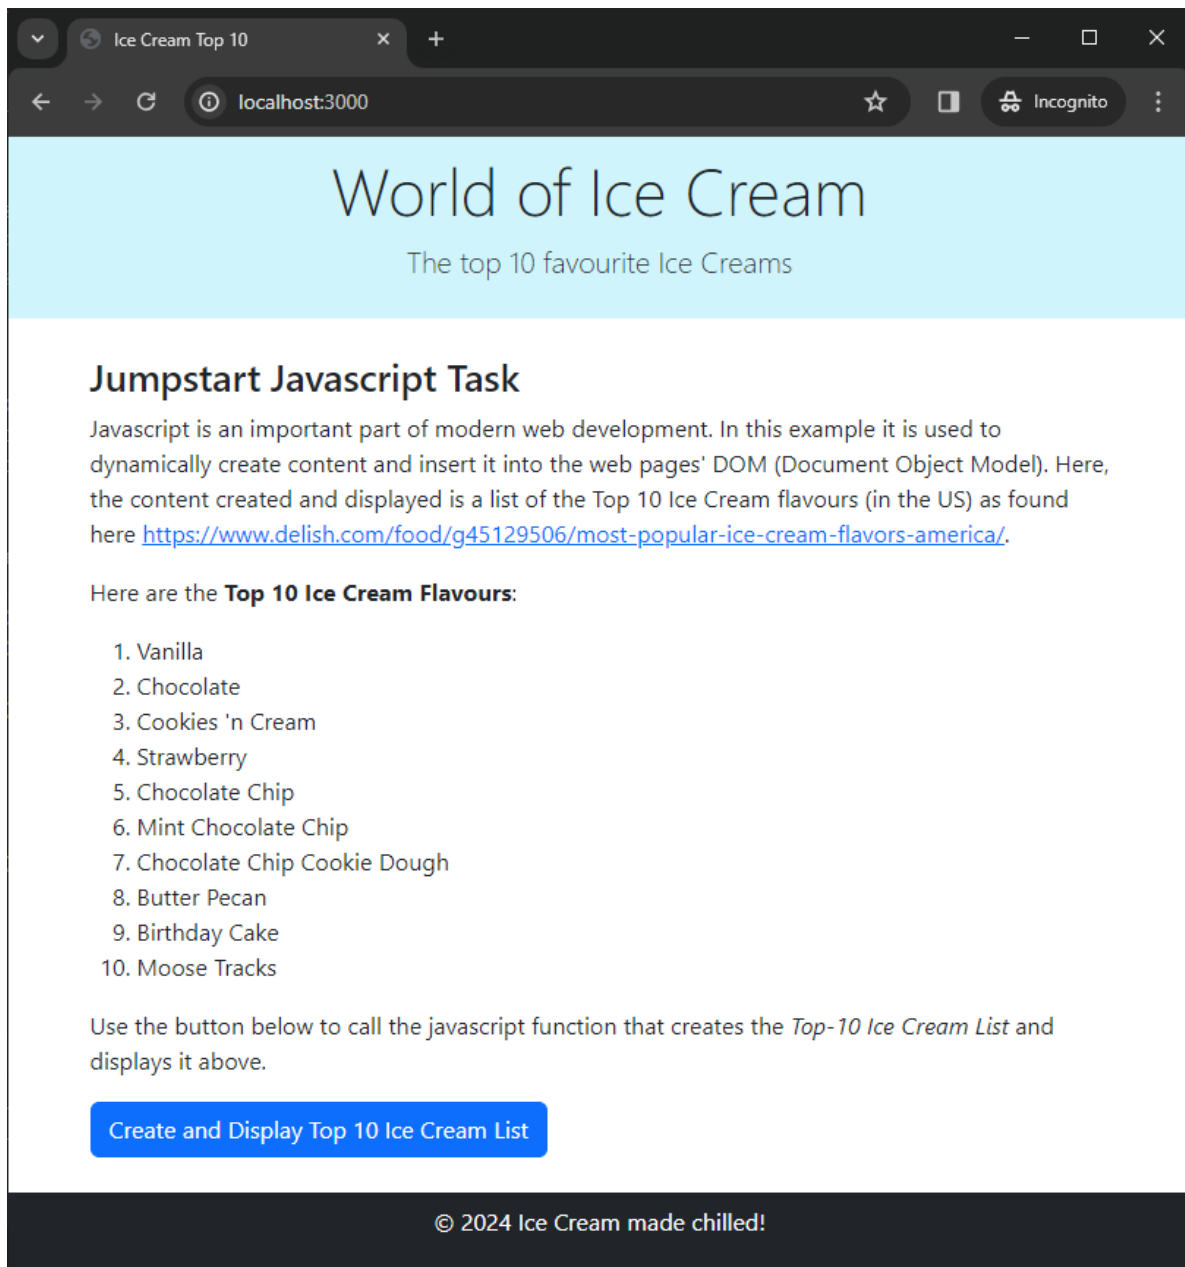

Including *Javascript* with your *HTML* and *CSS* code enables your webpage to be far more interactive and dynamic. In this task you will explore how to create content **dynamically** within your web page using javascript arrays, loops and functions.

In this task, you are required to create an **ordered list** that is built *dynamically* and contains the Top 10 favourite Ice Cream flavours (in the US). This list should be created when the user clicks a button.

A sample structure for the page (before and after) is shown below:

Jumpstart Javascript - Ice Cream List is empty

Jumpstart Javascript - Top 10 Ice Cream List is populated

To complete this tasks, you are asked to create a javascript function called `buildIcecreamList()` that you will add to a file called `icecreamList.js`. We have provided you with the frontend HTML code (using CSS Flexbox and Grid) that you can use as a basis of this project. The `html` file can be found in the resources tab in this task's OnTrack page (located in bottom right hand corner of task-page).

Hints

- In the Javascript function that builds the ordered list of ice cream favourites from an array of strings. You will need to create an array of strings (a string for each of the ice cream names).
- The `div` block within the webpage called `top_icecreams` is the section that you

will be replacing with new HTML content, i.e., the newly created ordered list.

- To replace the existing content, you must first remove the current content (initially a paragraph saying *List is empty*) by using the `removeChild()` method
- You can then add the ice cream list as a child of the `top_icecreams` div using the `appendChild()` method.
- The fragment of javascript that defines the array holding the ice cream flavours is given below:

```
// List drawn from https://www.delish.com/food/g45129506/most-popular-ice-cream-flavors-america/

const icecreamArray = [
  "Vanilla",
  "Chocolate",
  "Cookies 'n Cream",
  "Strawberry",
  "Chocolate Chip",
  "Mint Chocolate Chip",
  "Chocolate Chip Cookie Dough",
  "Butter Pecan",
  "Birthday Cake",
  "Moose Tracks",
];
```

NOTE: In your browser's console (from the developers->inspect tool), check to see if there are any errors displayed from your page/javascript, especially in the case where you hit the *Create List* button a second time. This may require you to look at how you create/remove the existing content (or nodes) from the DOM.

What will you submit?

You should submit:

- Screen-shot of the web page showing the output **before** the button has been clicked.
- Screen-shot of the web page showing the output of **after** the button has been clicked.
- The `HTML` file of the webpage `task7-1.html`
- The new `JavaScript` file `icecreamList.js`
