

SIT 218/738: Secure coding

Pass task 1.2P: Dataflow diagram

Note: Before you start working on this task, you will need to complete “the Task1.1P and 1.2P Start Activity” and study other related content in ClouDeakin unit site.

Overview

Your task is to draw a dataflow diagram for the following web application.

Application Description:

This web application is a portal for performing static code analysis of software. The users of the application are software developers, their managers and administrators of the web application. The users are authenticated using a cloud based active-directory server which manages their identities. The software developers can upload their code to the webserver and perform a static code analysis (which is run in the application server) on the portal. Then the developers can view the reports from analysis (scan results stored in the database) and prioritise the vulnerabilities to be addressed and resolve the fixed vulnerabilities (stored in the database). The developers can also use their own IDEs to interact with code analyser via the web services API and perform the static code analysis. Their managers can view the vulnerabilities reported by the scan tool, view the progress made by the development team in fixing the vulnerabilities. The administrators can manage the whole web application.

Your task is to:

1. Identify and list all the external entities, data flows, data stores, and processes in the application.
2. Draw a Level 1 Data Flow Diagram (DFD) illustrating the flow of data between components, users, and external systems. Your DFD should include all the external entities, data flows, data stores, and processes in the application.
3. Clearly indicate the entry points and mark the trust boundaries and label them explicitly on the diagram. Use appropriate symbols for DFD elements and trust boundaries as mentioned in the **Task1.1P and 1.2P Start Activity**.

You can use Draw.io, Lucidchart, Microsoft Visio or any other tool to draw your DFD. **Hand drawing is NOT acceptable.**

Submission Requirements:

Submit one PDF file via OnTrack.

Submission Due

The due for each task has been stated via its OnTrack task information dashboard.
