

Task 6.3D

Explanation

Building the Contact page was pretty straightforward. I've made forms like this many times before, so most of the work was carrying over decisions I already made instead of solving something new.

The layout follows the 6.2C wireframe closely. Header and navigation at the top, grouped fields in the middle, reset and submit buttons side by side, then footer at the bottom.

The main change from the plan was replacing the original "upload photo" idea with a proper Contact Us page. I added a reason dropdown, optional scan date, and message field. It made more sense after thinking about what a shopper reporting a bad scan actually need to say, instead of only uploading the image again.

Name, email, and phone are placed in a two-column grid, which changes into one column on mobile. The dropdown and message field stays full-width on every screen size. This was an easy decision since the same 48rem breakpoint pattern is already used everywhere else on the site.

That keep it usable one-handed for Raj while scanning in a store. It's also readable without zooming for Madison when she fill it in later at home. Same target users, and same responsive habits I already had across the site.
